

Build with AI: AR Edition

Overview

Build with AI: AR Edition is a one-day live coding event powered by Cognivision, a spatial computing platform that lets developers build real augmented reality and computer vision mobile applications using AI. The event starts with a hands-on workshop where Cognivision trains all participants on the platform, then transitions directly into a live build competition where students use what they just learned to create something real.

No prior AR experience is required. The workshop is designed to get you building from zero. What is being tested is your ability to think creatively, pick up new technology fast, and ship something that works.

Students who impress during the competition may be considered for internship opportunities with Cognivision.

Participation format: Solo, Duo, or Triplet

Venue: DHA Suffa University

Duration: 1-Day Event (June 8, 2026)

Tools: Cognivision platform via VS Code. All AR, computer vision, and on-device ML tooling is handled by the platform. You describe what you want to build in plain English and the AI assembles it.

Prerequisite: Basic mobile app development understanding is preferred. No prior AR or computer vision experience needed.

Registration Fees

Solo — Rs. 500

Duo — Rs. 1,000

Triplet — Rs. 1,500

Timeline and Format

Session 1 — Workshop (60 minutes)

Cognivision conducts a structured hands-on training session for all registered participants. This covers what augmented reality and computer vision are, how the Cognivision platform works, and how to go from a plain English prompt to a working AR mobile application. Every student gets a prompt card with a real AR or computer vision idea and builds a working

version of it during this session on their own device. Cognivision mentors are present throughout.

By the end of the workshop, every participant will have built and run at least one working AR application.

Session 2 — Live Build Competition

Immediately following the workshop, the event transitions into the competition. Students are given a new build prompt and a time window to create the best possible AR or computer vision application they can on the Cognivision platform. Cognivision mentors remain available for technical support throughout the build session.

Submissions are evaluated by Cognivision on technical execution, creativity, use case relevance, and whether the application ships and runs correctly within the time limit.

Results and Awards

Winners announced at the closing ceremony on June 10, 2026, at the Spectrum 26 awards event. Top three are invited on stage.

What You Will Build

The competition gives participants access to the full Cognivision spatial stack — AR, computer vision, and on-device machine learning — all through a single platform inside VS Code. Example builds from the platform include:

Real-time object detection and classification using the phone camera, face tracking with live overlay effects, AR object placement on real surfaces, camera-based measurement tools using spatial anchoring, gesture recognition without touching the screen, and interior design visualisation with furniture placed accurately in a real room.

The actual competition prompt will be revealed on the day.

Judging Rubric

Technical execution Does the application actually work? Does it run on a real device and do what it is supposed to do?

Creativity and use case Is the idea novel? Is the AR or computer vision capability being used in a way that makes sense and adds value?

Completion within time Was the application shipped within the competition window?

Demo quality Can the participant explain what they built and why the idea is worth pursuing?

Prize Breakdown

1st place — Rs. 20,000

2nd place — Rs. 10,000

3rd place — Certificate and goodies, recognised on stage at the awards ceremony

Total prize pool: Rs. 30,000

All participants receive a certificate of participation and Cognivision platform beta access with monthly token rewards for up to one year.

Rules and Regulations

Solo, duo, and triplet participation is allowed.

All building must take place during the official competition window on the day. Pre-built applications are grounds for disqualification.

The Cognivision platform must be used for the build. Support from Cognivision mentors is available and encouraged.

Participants must bring their own laptop and a personal iPhone or Android device for real-device testing. Developer mode must be enabled on the device before arriving.

Basic mobile app development understanding is preferred. Participants with no programming background at all may find the session challenging.

Sharing code or builds with other registered participants during the competition is not permitted.

Any violation results in disqualification with no refund.

What to bring

Laptop with VS Code installed, an iPhone running iOS 16 or above or an Android device running Android 8.0 or above, a USB cable for device connection, and at least 60% battery on your phone as AR is power intensive. Full system requirements will be shared through the participant WhatsApp group before the event.
